Safety Information

Electrical safety

- To prevent electrical shock hazard, disconnect the power cable from the electrical outlet before relocating the system.
- When adding or removing devices to or from the system, ensure that the power cables for the devices are unplugged before the signal cables are connected. If possible, disconnect all power cables from the existing system before you add a device.
- Before connecting or removing signal cables from the motherboard, ensure that all power cables are unplugged.
- Seek professional assistance before using an adapter or extension cord. These devices could interrupt the grounding circuit.
- Make sure that your power supply is set to the correct voltage in your area.
- If you are not sure about the voltage of the electrical outlet you are using, contact your local power company.
- If the power supply is broken, do not try to fix it by yourself. Contact a qualified service technician or your local distributor.

Operation safety

- Before installing the motherboard and adding devices on it, carefully read all the manuals that came with the package.
- Before using the product, make sure all cables are correctly connected and the power cables are not damaged. If you detect any damage, contact your dealer immediately.
- To avoid short circuits, keep paper clips, screws, and staples away from connectors, slots, sockets and circuitry.
- Avoid dust, humidity, and temperature extremes. Do not place the product in any area where it may become wet.
- Place the product on a stable surface.
- If you encounter any technical problems with the product, contact your local distributor

2.17 Thermal Management and Fan Control

Nuvoton NCT6104D Super IO: backup alternate solution as it leverages existing hardware in the designs, but software infrastructure must be put in place to support this solution.

Regardless of solution chosen, BIOS/driver/tools support and subsystem validation is required, even if solution is not needed by pilot.

Board must use Super IO solution for hardware monitoring and thermal management. Super IO implementation must be supported by BIOS, tools and drivers necessary for custom thermal profile management no later than by fab B samples.

BIOS/tools/driver support and subsystem validation is required.

The thermal management capability must support temperature sensors near CPU VR FETs as well as near or on the memory components; shall only one temperature sensor be feasible it must be located near the CPU VR FETs.

The following thermal management features must be supported:

Temperature monitoring at the following locations:

- remote diode near CPU VR FETs
- remote diode near or on the memory components
- Voltage monitoring (in priority order): +12V, V_SM, CPU VCC_VCGI, CPU VNN_SVID

2.19 Fan Header Requirements

The below requirements must be met for the 4-pin processor/heatsink fan (CPU FAN) header:

- ☐
- Closed loop fan speed control via the FANPWM0 signal routed to pin-4 ☐
- Route fan tachometer signal to FANTACH0 input ☐
- Support 2A continuous draw ☐
- Clearly label as “CPU FAN” ☐
- Locate closest to the CPU as required by the CDPG boxed CPU
